

Polyrey is committed to the protection of the environment throughout all stages of the fabrication process and life cycle of its products:

1. **Origin of raw materials:** Polyrey's core boards for its Panoprey and Polyrey products are PEFC certified.
2. **Heavy metals and toxic products:** Polyrey does not use heavy metals or toxic components containing chrome, mercury or lead.
3. **Water and energy:** waste products are burned to produce recycled energy for use in the presses. Water consumption sourced from the Dordogne for the Couze factory (France) has been reduced by 10 in 15 years.
4. **Non recyclable waste products:** Polyrey has reduced the number of its non recyclable waste products by 96% in 10 years. Up to 70% of Polyrey's waste products are burned and converted into water energy. The amount of recycled waste products has increased by 1.6.
5. **Air pollution:** Polyrey led the way in 1997 with the installation of a treatment plant for Volatile Organic Compounds where dust is filtered, stored in silos and burned to produce energy.
6. **Water pollution:** Water pollution is monitored on a daily basis. Polyrey's achievements throughout the monitoring process (quantity, temperature, pH...) are higher than DRIRE requirements: in the last 10 years, the release of nitrogen has been reduced by 19, the phenolic index by 24.
7. **Noise pollution:** the level of noise has been reduced internally by the installation of a protective surrounding around machines and externally by the construction of an anti-noise wall.
8. **Packaging:** All packaging materials are recyclable: wooden pallets, boxes, polyester and polypropylene dividers. Pallets are sourced from wood from managed and sustainable French forests.
9. **Life cycle of products:**
 - Products are non-toxic. With no formaldehyde emissions, HPL surfaces are chemically inert.
 - End of lifespan: the products can be incinerated providing a high calorific value for the production of energy.
